Levelling foot GN 440.5 with vulcanised rubber

News from Ganter in Furtwangen

Ganter of Furtwangen offers an extensive range of levelling feet (machine bases) for levelling machines on uneven floors.

The GN 440/ GN 440.5 levelling feet are straightforward and very reasonably priced feet variants. The static load capacity of these articulated feet is limited by the permissible load limit of the screw (strength class 5.8). It is available with or without vibration-damping anti-slip coating. The most recent version is the design with vulcanised rubber which is unique in the market. The outstanding feature of this rubber is its captive design.

The GN 340.1 / GN 340.6 levelling feet feature a solid NBR rubber support, imbedded firmly inside the sheet metal plate and in addition held in place in axial direction by a fixing screw. The fixing screw vulcanised into the rubber support allows the levelling foot to be bolted firmly and rigidly to the floor.

The spindle screws of all levelling feet can be adjusted at the top end either with a hexagon socket spanner or with the key surface at the bottom end of the screw.

For special requirements in terms of hygiene, the levelling feet with vulcanised rubber are the ultimate solution because they do not allow dirt to settle and are therefore ideal for use in the food industry (e.g. GN 440.5 levelling feet, Form GV).

For applications demanding high corrosion resistance or requiring anti-magnetic properties, Ganter's product range includes the GN 340.6 and GN 440.5 stainless steel levelling feet.
